Dedication

To my parents, for all they sacrificed to give me education
Acknowledgements

I am profoundly grateful to all people and organizations who in one way or the other assisted me in the realization of this piece of work. I may not be able to mention all by name and their specific contributions. However, I feel indebted to mention a few.

I gratefully acknowledge the generous received financial support from NORAD, EWS Stiftelsen and the Norwegian International Health Association (NIHA) without which this thesis and my studies at the University of Oslo would not have been possible.

To the Director MISR, Dr. Nakanyike B. Musisi, I thank you very much for nominating me for admission to the University of Oslo.

I owe a lot to my main supervisor, Dr. Joar Svanemyr and the co-supervisor, Prof. Johanne Sundby, who guided me patiently and with admirable expertise.

Special mention also deserves of my Local Supervisor - a colleague and friend, Mr. John Frank Mugisha, for his part. I am profoundly grateful for his unwavering moral and technical support through this process.

I am also greatly indebted to Prof. Grimen Harald and Ms. Camilla Hansen for their part regarding the qualitative methodology utilized in this study. Their comments during proposal development were very insightful.

To the dutiful staff of the University of Oslo, I thank you very much for being friendly and supportive. I am particularly indebted to the co-coordinators: Ms. Vibeke C and Ms. Ine A as well as Ms. Lynn J - the NORAD International Students’ Advisor, for providing an enabling environment.

I am also very grateful to friends, Mr. Xavier Nsabagasani and Mr. Denis Muhangi for their support. I particularly thank them for sparing their valuable time to read through this thesis and draw my attention to areas of inconsistence.

To the Kabali’s family, innumerable thanks to you for your moral support and care to my family.

I am also very grateful to Mr. Solomon Kakande - my field assistant and Mr. Alfred Etwom for their invaluable assistance during field data collection and quantitative data analysis respectively.

In a special way, I gratefully thank my wife Annet, for her part especially for single-handedly taking care of our beloved daughter Beatrice during my absence. To our beloved Beatrice, you have been my main source of inspiration in this academic battle and you will always find a special place in my heart.

Last but not least, many thanks to all participants of this study who sacrificed their time to share with me their experiences about use of modern contraceptives. To the Jinja district, Butagaya sub county as well as the community leadership, many thanks to you for welcoming me warmly in your offices. I am particularly indebted to the members of the various Local Council Ones (villages) of Butagaya sub county, for their untiring guidance and recruiting participants of FGDs for me.
Executive Summary

**Introduction:** Despite the significant investments put into improving the provision of contraceptive services in Uganda, the desired outcomes have not been realized. Contraceptive prevalence rate remains low and only 18% of the currently married women are using a modern method. Total fertility rate is as high as 6.9 and there is a huge unmet need for contraceptive use among women estimated at 35% (UBOS & ORC Macro, 2001). One of the reasons often mentioned for these poor reproductive health outcomes is lack of male involvement and support for contraceptive use. The current study explored men’s perspectives and use of modern contraceptives within marriage. The results of this study are anticipated to be a valuable input into interventions aimed at increased engagement of men in contraception and other reproductive health battles.

**Methods:** It was a cross sectional study carried out in one randomly selected rural sub-county (Butagaya) in Jinja district in eastern Uganda. A combination of qualitative as well as quantitative methods of data collection were utilized in a complementary manner and included: 7 focus group discussions, 8 in-depth interviews, 3 key informant interviews and structured interviews with a random sample of 140 married men. Besides married men, other study participants included married women and staff of health facilities offering contraceptives services within the sub county.

**Key findings:** Majority (80.7%) of men were not using contraceptives even when convenient services were purportedly freely available because a larger proportion (39.7%) of men was pro-children. In this society, children were highly valued for a variety of economic, social and cultural reasons. The pro-children notions were reinforced by high mortality rates among children due to inadequate health care system. Men perceived contraception as a means to deny them children, which threaten them with derision and ostracism amongst their male peers. The pro-children notions were very strong to overshadow any other view. For instance, whereas majority of men were aware of the risks women are exposed to as a result of repeated childbearing, they remained unbothered and continued to desire for more children.

However, the pro-children notions were being questioned in light of the growing poverty in many homes. Some men associated many children with problems and perceived contraception as a means to solve it although such opinions were held by a minority and were expressed in the context of considerable ambivalence. Program managers could take advantage of this optimism in order to invoke positive change. Men also expressed fears that contraception facilitates women to conceal their involvement in extra marital relationships. Even though, some men may allow their wives to use contraceptives, they remain suspicious and uncomfortable due to such a belief.

Whereas the negative side effects of modern contraception are a reality to women, men were more concerned about the inconvenience they create in terms of interrupting their daily sexual enjoyment than the health of the spouse. The issue of negative side effects raises a quality of care concern, hence suggesting that addressing contraceptive barriers at community level needs intervention at clinic level as well. In addition, given that majority of women use contraceptives secretly, it is important to note that a woman who hides the method she uses and experiences side effects with that method is at the risk of stopping the method rather than changing to another one that is likely to be detected by her husband.
This study has demonstrated that despite the changing attitudes among men and their endorsement of the shared responsibility between a man and woman in as far as reproductive and family responsibilities are concerned, it remains theoretical. Women do not enjoy any rights partly because they are not aware of them and men continue to dominate them. The secret use of contraceptives by women with it’s inherit problems is clear testimony of this.

Despite the high levels of awareness about contraceptive methods among men, they perceived contraception in terms of stopping childbearing completely or practicing it when the desired number of children has been attained. There were also beliefs such as; contraceptives can inflict harm, cause infertility and even death to those who use it. Condoms use (44.4%) though the commonly used method amongst men was associated with extra marital affairs for prevention of STDs particularly the deadly HIV/AIDS rather than as a method of contraception. It was perceived improper to use a condom with one’s spouse.

**Conclusion:** The results of this study generally suggest that even if men had more or a variety of contraceptives beyond the condom, vasectomy and withdrawal, their acceptability to use those contraceptives would not be necessarily significantly better without changes at the society level.

**Recommendation:** A strong educational campaign at the grass root remains a key strategy. It should utilize the multi-media approach and focus more on behavior change among men. However, the success of this effort will require patience and resolve with a sense of strategic partnership with men and community local structures.
