Abstract
Background: The COVID-19 has posed a wide range of urgent questions: about the disease, testing, immunity, treatments, and outcomes. Extreme situations, such as pandemics, call for exceptional measures. However, this threatens the production and application of evidence.

Methods: This article applies standard categories in epistemology to analyse the pandemic in terms of four kinds of uncertainty: Risk, Fundamental uncertainty, Ignorance, and Ambiguity.

Results: Mapping the uncertainties of the pandemic onto the four types of uncertainty directs evidence production towards specific tasks in order to address the challenges of the pandemic: Eliminating ambiguity, being alert to the unknown, and gathering data to estimate risks are crucial to preserve evidence and save lives.

Conclusion: In order to avoid fake facts and to provide sustainable solutions, we need to pay attention to the various kinds of uncertainty. Producing high-quality evidence is the solution, not the problem.

Keywords
ambiguity, evidence, ignorance, risk, uncertainty

1 | GETTING TO TERMS WITH UNCERTAINTY

The uncertainties of the COVID-19 pandemic can be mapped onto four types: Risk, Fundamental uncertainty, Ignorance, and Ambiguity. With Risk we have known outcomes and we know their probability distributions. With Fundamental uncertainty we know the outcomes, but not the probability distribution. When being ignorant we know neither. Ambiguity arises when experts disagree over the framing of possible contexts, options, outcomes, benefits, or harms.

Table 1 gives an overview of some specific and crucial uncertainties in the COVID-19 pandemic.

Making decisions based on risks is not easy, but commonplace. The problem with COVID-19 is that so many risks are unknown, as probability distributions are wanting. Moreover, decisions based on fundamental uncertainty tend to be speculative and potentially harmful. Decisions based on ambiguity "are not just potentially misleading..."
— they are a fundamental contradiction in terms. Therefore it is crucial to clarify definitions. Additionally, ignorance poses great challenges, as we do not know what we do not know—and hence where to search for solutions.

2 | TAKING UNCERTAINTY SERIOUSLY

No doubt, scientists are working relentlessly to find answers to the many questions and solutions to the pandemic. But the desperate situation appears to excite desperate measures. We are lead into what has been called a “once-in-a-century evidence fiasco.”

In order to target our efforts to reduce uncertainty, we need to pay attention to the various kinds of uncertainty. Reducing risk and fundamental uncertainty is in vain if ambiguity prevails. For example, increasing test accuracy (technically) has shown to be of little help when the sampling method or validation procedure is inappropriate. Correspondingly, great treatment efforts can be futile if we ignore important factors for preventing, diagnosing, or treating COVID-19.

Hence, the tasks for scientists strongly depend on the kinds of uncertainty. Accordingly, our tasks are fourfold and mapped in Table 2.

BACKGROUND

- The COVID-19 has posed a wide range of urgent questions: about the disease, testing, immunity, treatments, and outcomes.
- Extreme situations, such as pandemics, call for exceptional measures.
- This threatens the production and application of evidence.

What this article adds

- This article directs evidence production towards four types of uncertainty in order to address the challenges of the pandemic.
- The four types of uncertainty are Risk, Fundamental uncertainty, Ignorance, and Ambiguity.
- Eliminating ambiguity, being alert to the unknown, and gathering data to estimate risks are crucial to preserve evidence and save lives.
The first casualty of an epidemic is evidence. In extreme situations the imperative of action is strong.\textsuperscript{16} This makes extreme measures tempting—including scientific and ethical shortcuts.\textsuperscript{17,18} Rigorous evidential and ethical criteria appear to obstruct progress. However, producing high quality evidence is the solution to the pandemic, not the problem.

In order to avoid fake facts and to provide sustainable solutions science needs to pay attention to the various kinds of uncertainty. Eliminating ambiguity, being alert to the unknown, and gathering data to estimate risks are crucial to preserve evidence and save lives.
